

GitHub Repository Report – IS 594 Project Management

Student Name: Aanchal Malhotra

Repository Link: <https://github.com/Aanchal123/ProjectManagement>

Repository Overview

This GitHub repository was used to organize and manage coursework for IS 594: Project Management. It serves as a centralized workspace for storing assignments, lecture notes, and final project deliverables developed throughout the course. The repository structure reflects an effort to maintain clear organization and document progress on major course components.

Repository Contents

The repository is organized into the following main sections:

- **Assignments/:** Contains course-related assignments, templates, and supporting artifacts completed during the semester.
- **Lecture Notes/:** Includes brief summaries and notes capturing key project management concepts discussed in class, such as methodology selection, requirement uncertainty, feedback timing, and governance considerations.
- **Final_paper/:** Contains the final research paper and presentation materials submitted as part of the course's main project.
- **Reflection/:** Contains this one-page report summarizing the experience of creating and maintaining the repository.
- **Project Board:** A GitHub project board used to track tasks and progress during the semester and referenced during standups to communicate work status.
- **README.md:** Provides an overview of the repository purpose, structure, and course context.

Experience and Reflection

Using GitHub as a course repository provided a structured way to consolidate deliverables and manage versions of key documents such as the research paper and presentation. In addition to storing files, the repository also supported lightweight project management using a project board, which was referenced during standups throughout the semester to track progress and ongoing work. Maintaining the project board helped break down tasks, visualize status, and communicate progress more clearly during updates.

Organizing materials into clearly labeled folders improved clarity and made it easier to locate and review artifacts. Maintaining the repository reinforced the value of version control, documentation, and task tracking when working on longer, multi-stage projects. While much of the content was finalized toward the end of the semester, the experience highlighted how consistent maintenance of both repository contents and project tools can improve transparency and reduce end-of-term consolidation effort. Overall, this demonstrated how GitHub can function as both a documentation repository and a lightweight project management tool in an academic setting.
